**Columbia Estuary
Research Conference**

**Astoria, Oregon
29 April 2008**

1

2

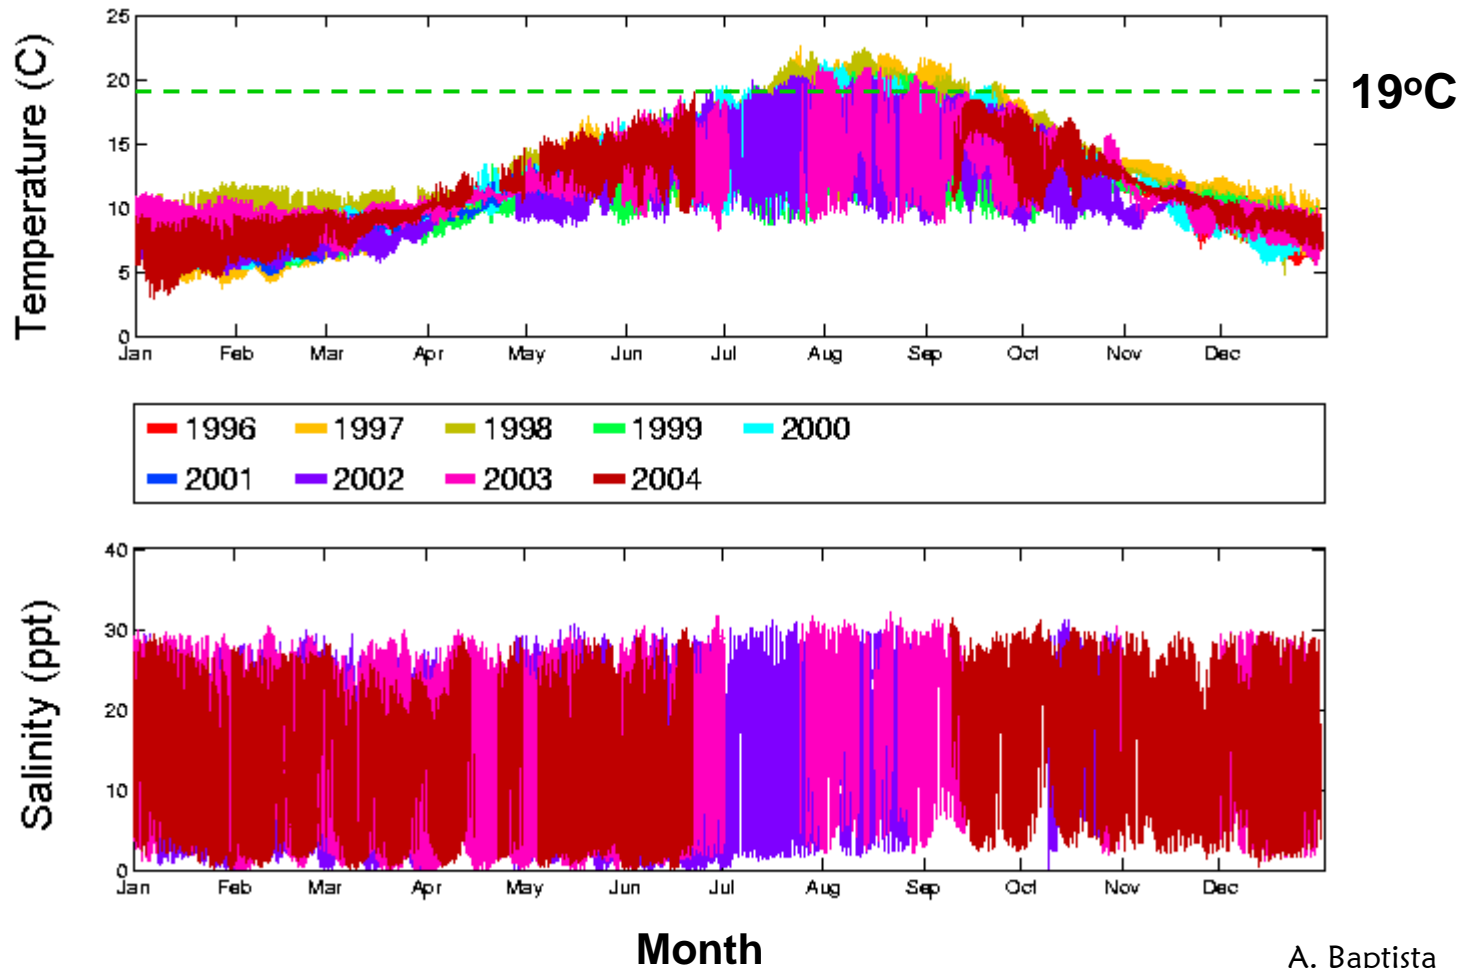

**Pacific Northwest
National Laboratory**
Operated by Battelle for the
U.S. Department of Energy

Themes

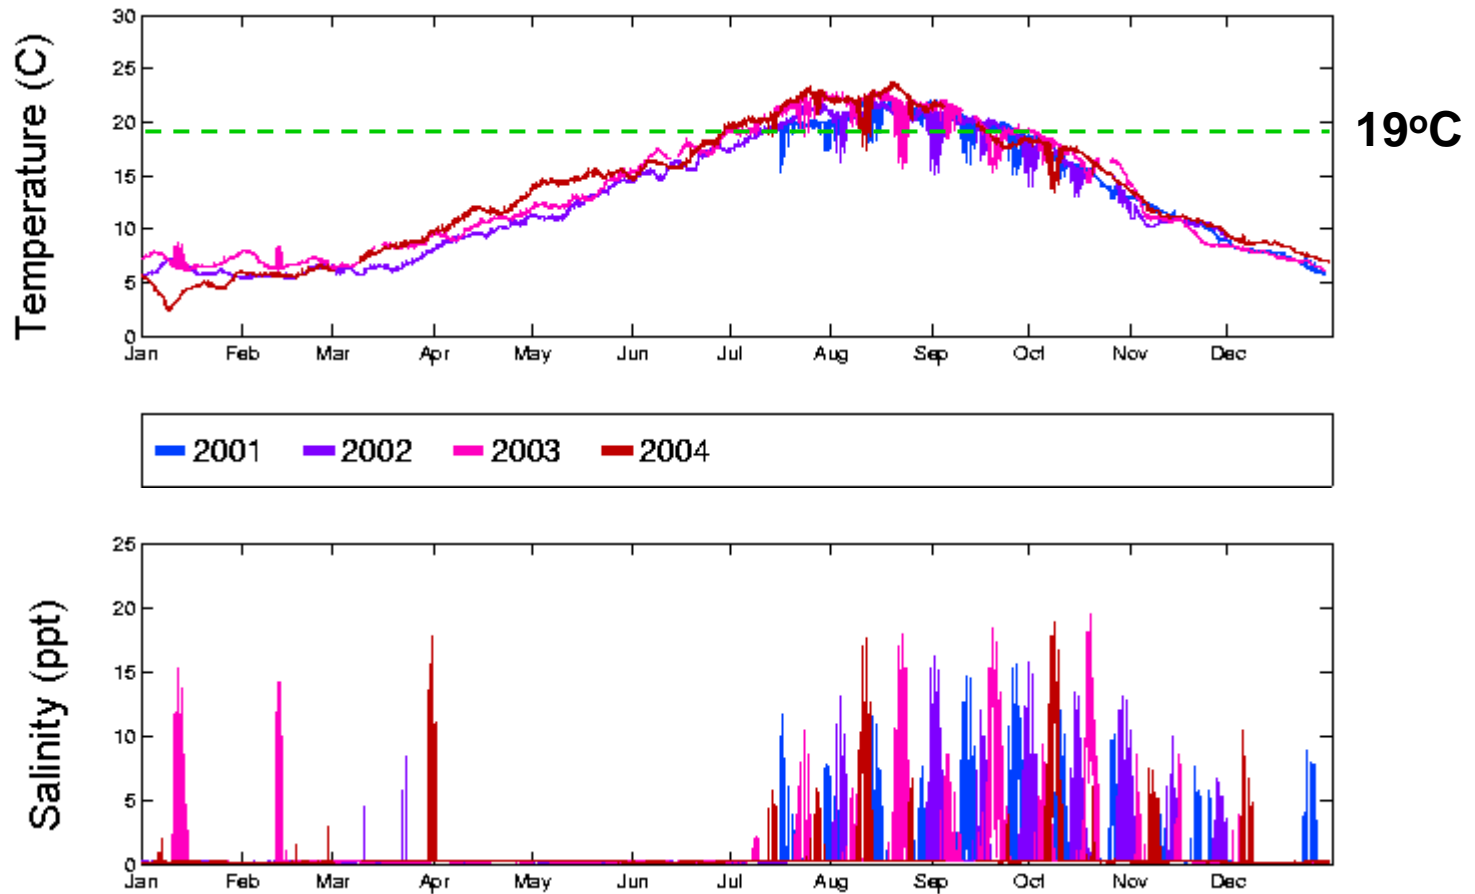

1. Contrast estuarine and tidal freshwater habitat
2. Concentrate on subyearling chum & Chinook salmon
3. Temperature effects

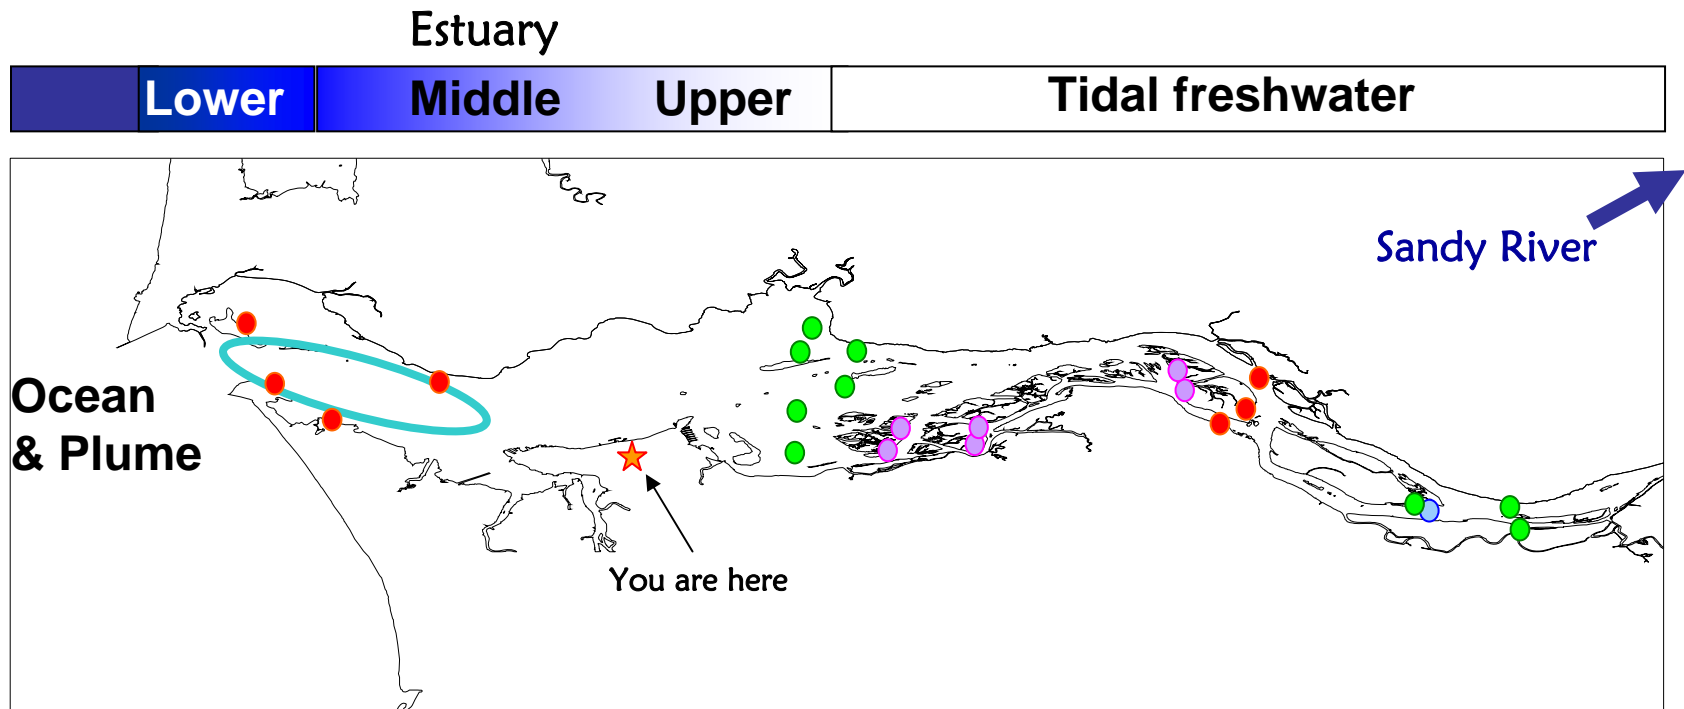

Temperature and salinity patterns: Marine influences

Ocean temperature influence: lower Cathlamet Bay

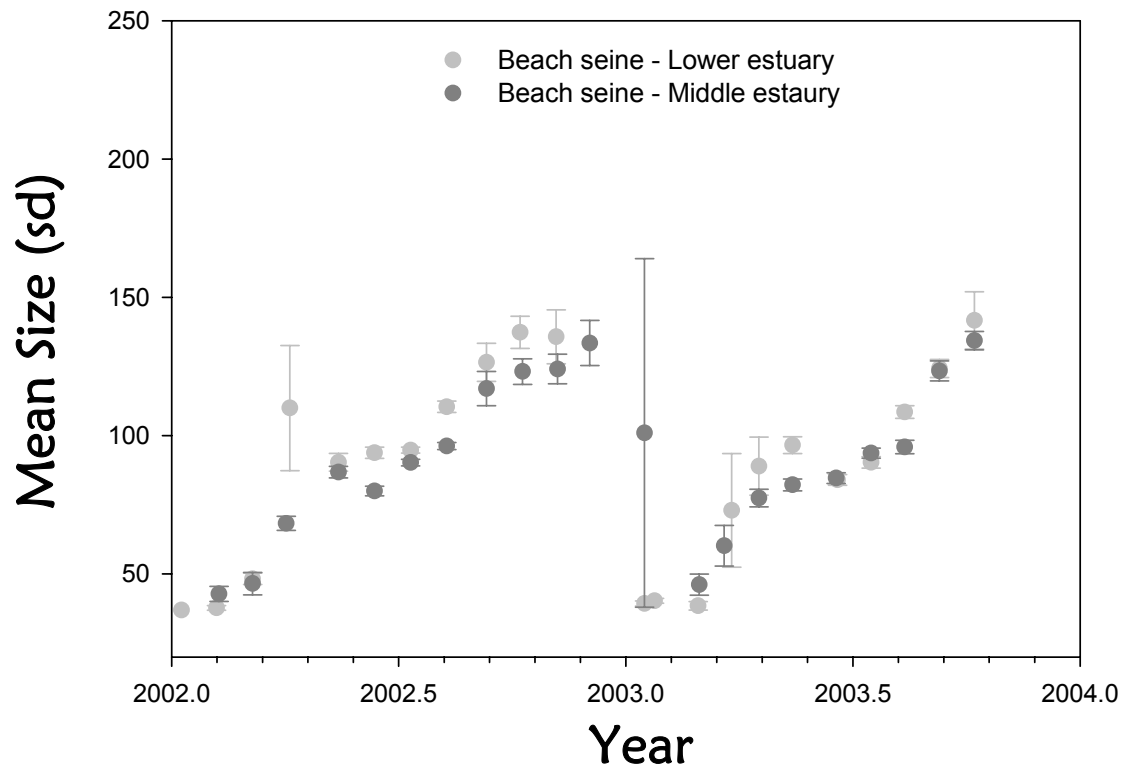

Studies – Spatial and temporal scales

1. Purse seine vrs beach seine
2. Tidal freshwater Sandy River delta
3. Landscape-scale time series monitoring
4. Synoptic spatial-scale “snapshot”
5. Wetland habitat use

Salmon in the Estuary

Proportional
catch

Beach Seine
N = 8475

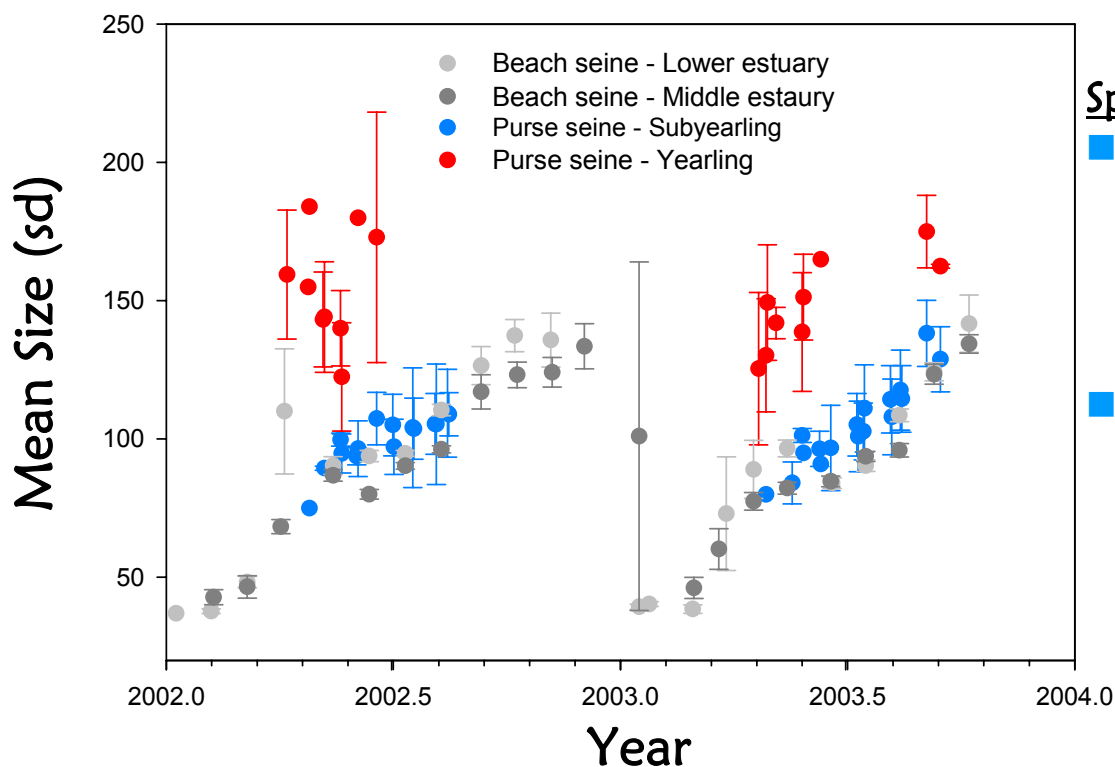

Salmon in the Estuary

Proportional catch

Beach Seine
N = 8475

Purse Seine
N = 1731

Spatial distribution

- Larger fish in main stem - move through system relatively quickly
- Smaller fish in shallow water – longer residence

"Stream-type" lineage

Upper Columbia R. sp

Snake R. sp/su

Mid-Columbia R. sp

Upper Willamette R. sp

Lower Columbia R.

Upper Columbia R. su/fa

Snake R. fa

Deschutes R. su/fa

"Ocean-type" lineage

Beach Seine

Purse Seine

Beach seine sampling: spatial scale

- Shallow water sites
- Counted all fish
- Measured up to 30 individuals / sps
- Measured up to 100 salmon / sps
- Up to 30 salmon retained
 - Genetic (stock identification)
 - Stomach contents (food habits)

Trap net sampling: Habitat study

- Sampling in tidal channels
- Trap set at high tide and sampled at low tide
- Emergent marsh, scrub-shrub, forested wetlands

Sandy River delta

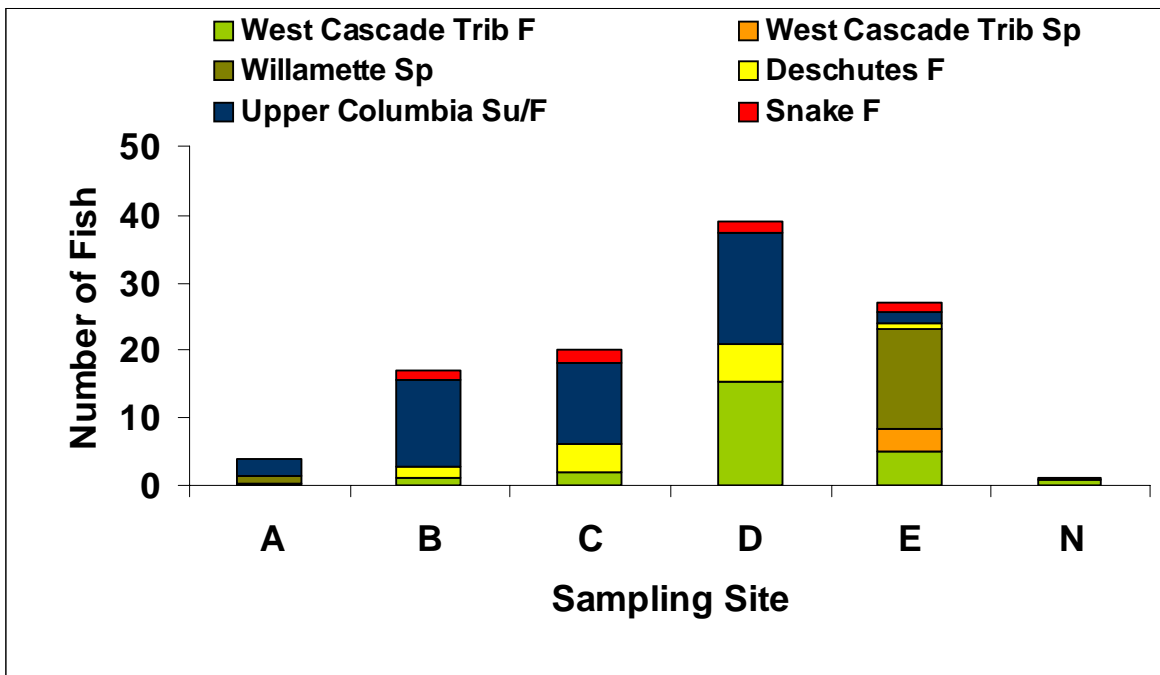

Community structure

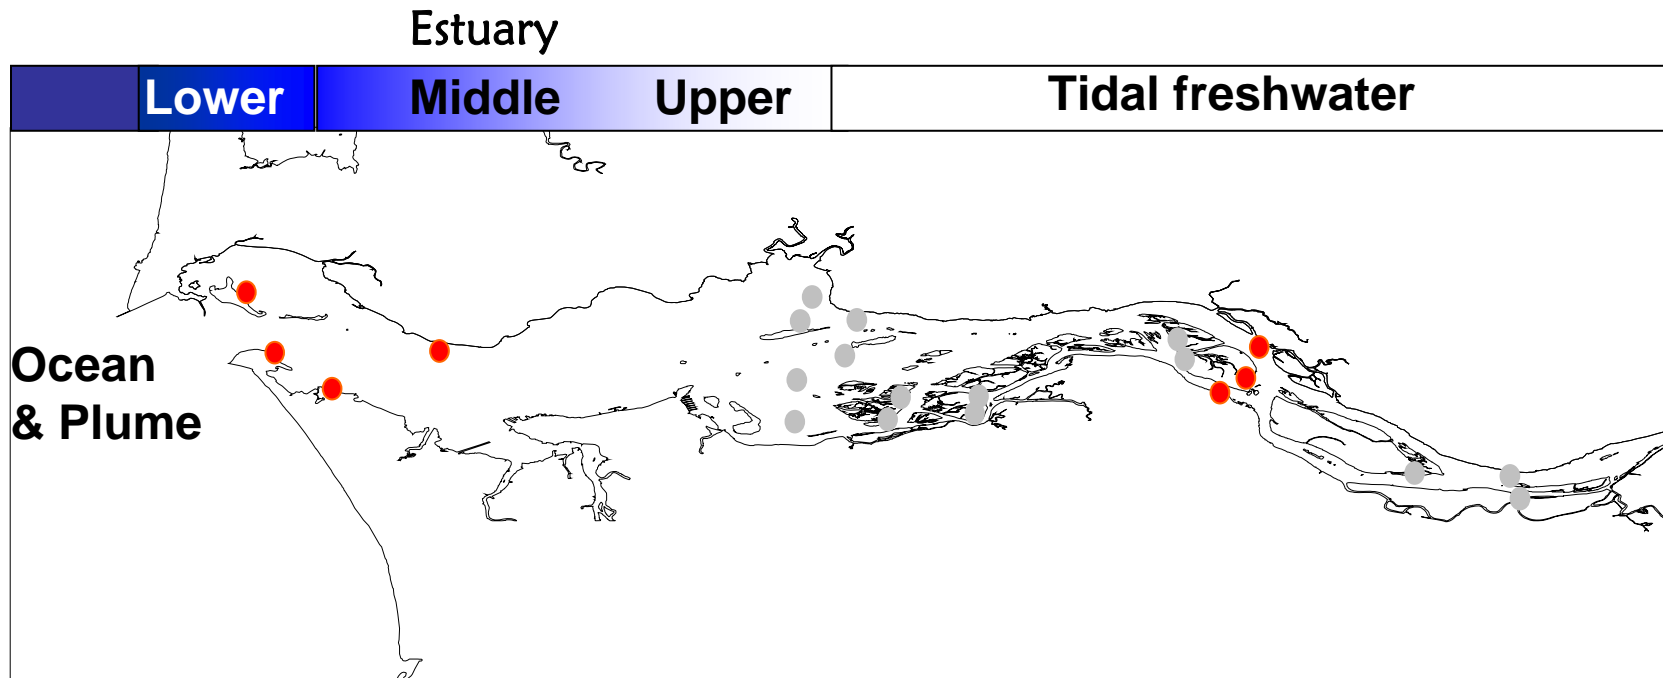

Chinook abundance & Temperature

Genetic Analysis

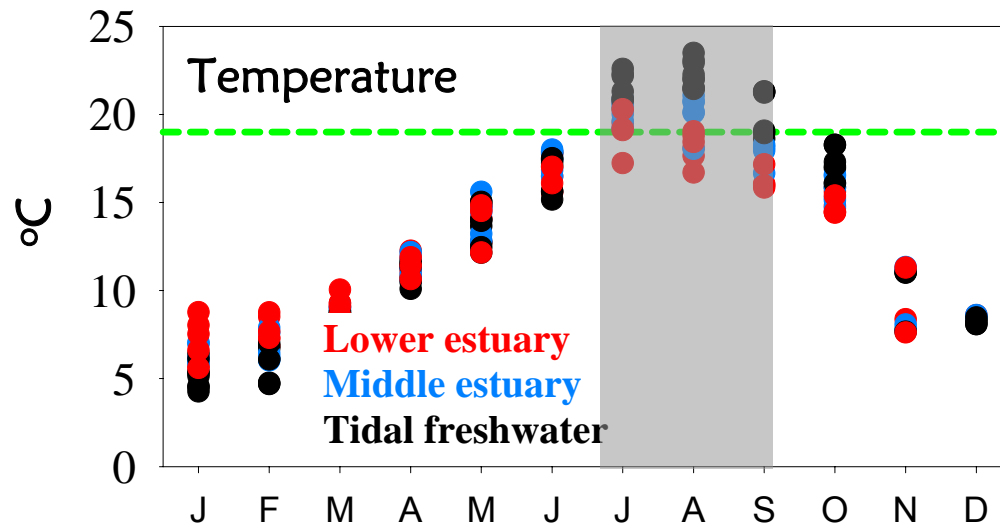

Studies – Spatial and temporal scales

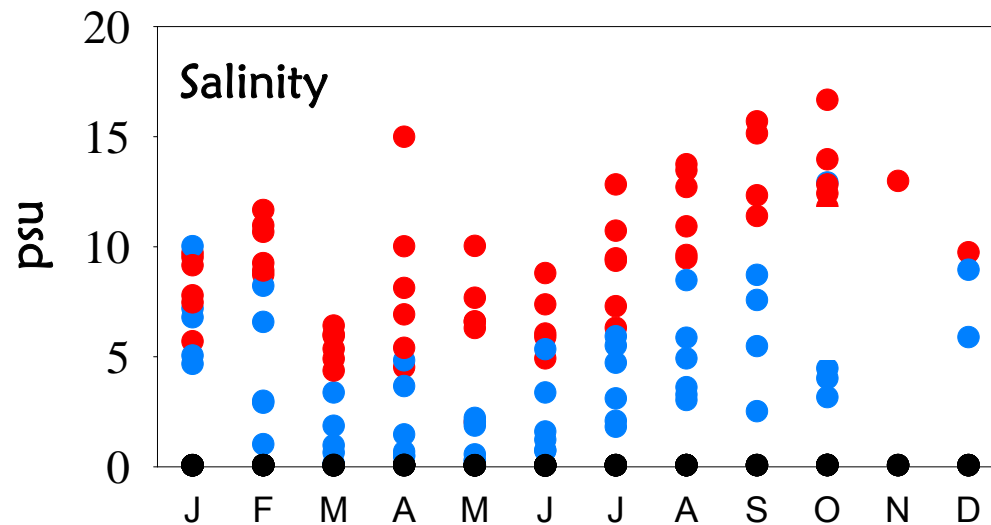

1. Purse seine vrs beach seine
2. Tidal freshwater Sandy River delta
3. **Landscape-scale time series monitoring**
4. Synoptic spatial-scale “snapshot”
5. Wetland habitat use

Monthly water parameters measured during beach seining

Temperature

- Exceeds reference Jul-Sep
- TFW > estuary

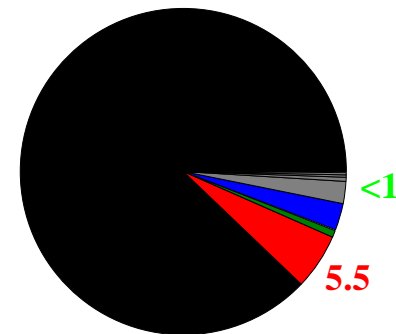

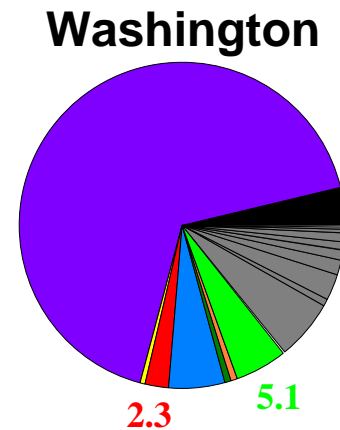

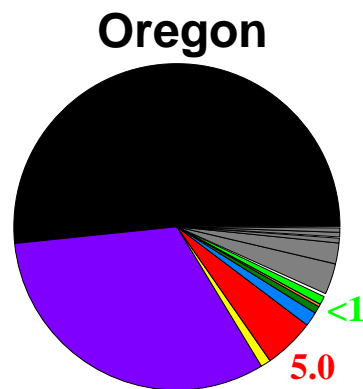

Salinity

- Measurable salinity during all samples in estuary

Month

Fish community structure at estuarine beach seine sites 2002-2007

- Spatial variation along salinity gradient
- Chinook Salmon 2.4-5.0% of catch
- Chum Salmon <1-5% of catch
- Chum more abundant on Washington side

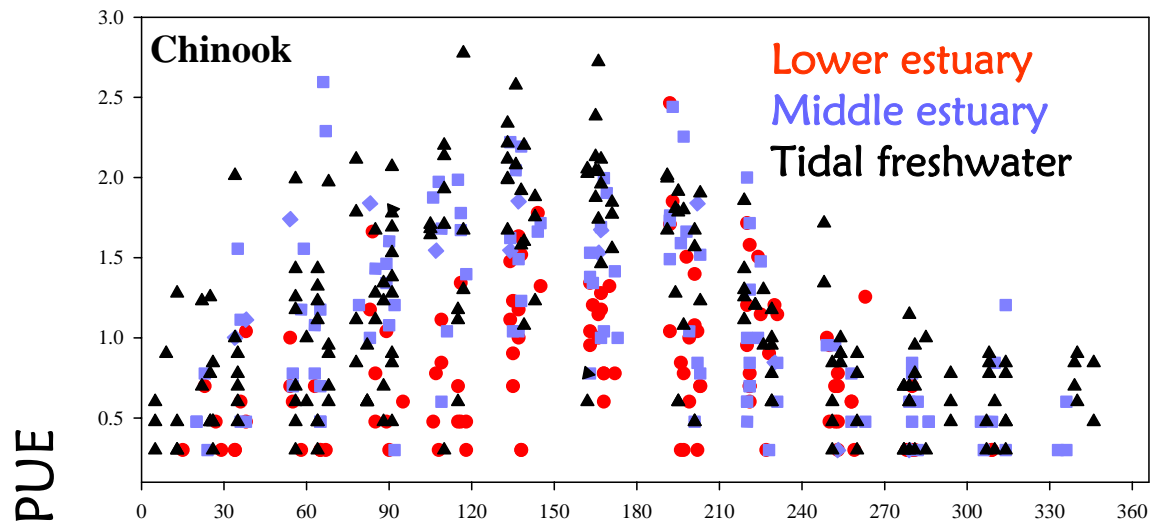

Lower Estuary

Middle Estuary

Freshwater

Temporal pattern of salmon migration 2002-2007

Chinook

- Broad abundance Feb-Aug
- Year-round distribution
- CPUE tends to be higher in TFW than estuary

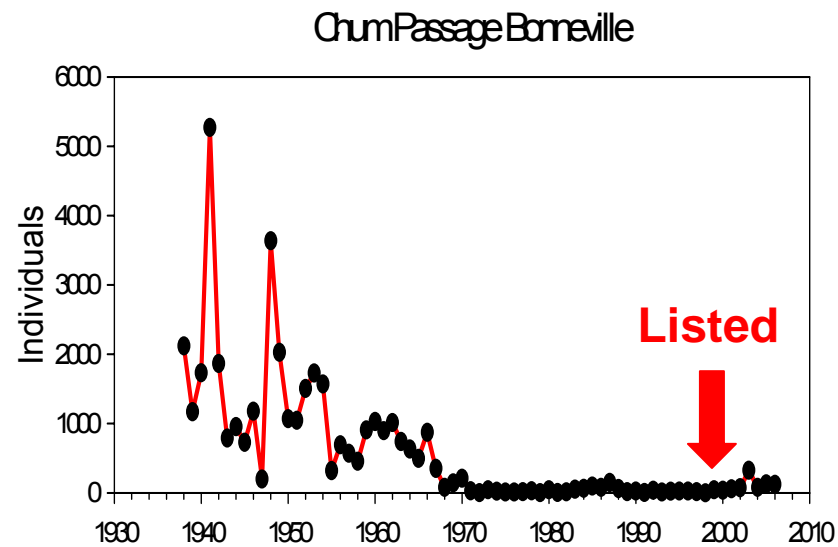

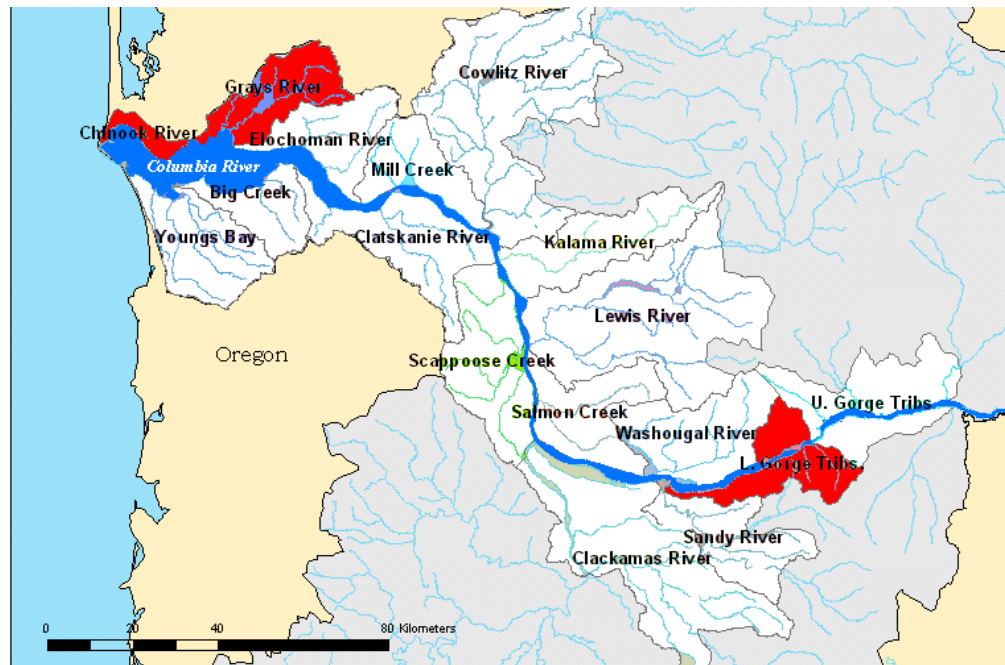

Chum

- Narrow peak Mar-Apr
- Absent > May
- Few chum in TFW

Distribution of chum spawning grounds

- Historic annual run > 1.3 million fish, After 1959 between 300 and 6000 fish
- Historic distribution: CR mouth to Walla Walla River (mainly below Celillo Falls)
- Present pattern: limited number of spawning locations on Washington side:
 - ⇒ Chinook River & Grays River
 - ⇒ In mainstem CR near Ives Island, and nearby Hamilton and Hardy Creeks
 - ⇒ In mainstem near I-205 bridge, also near Multnomah Falls
- Extirpated from Oregon side.
- Appear to spawn where gradient changes and hyporheic flows exist.

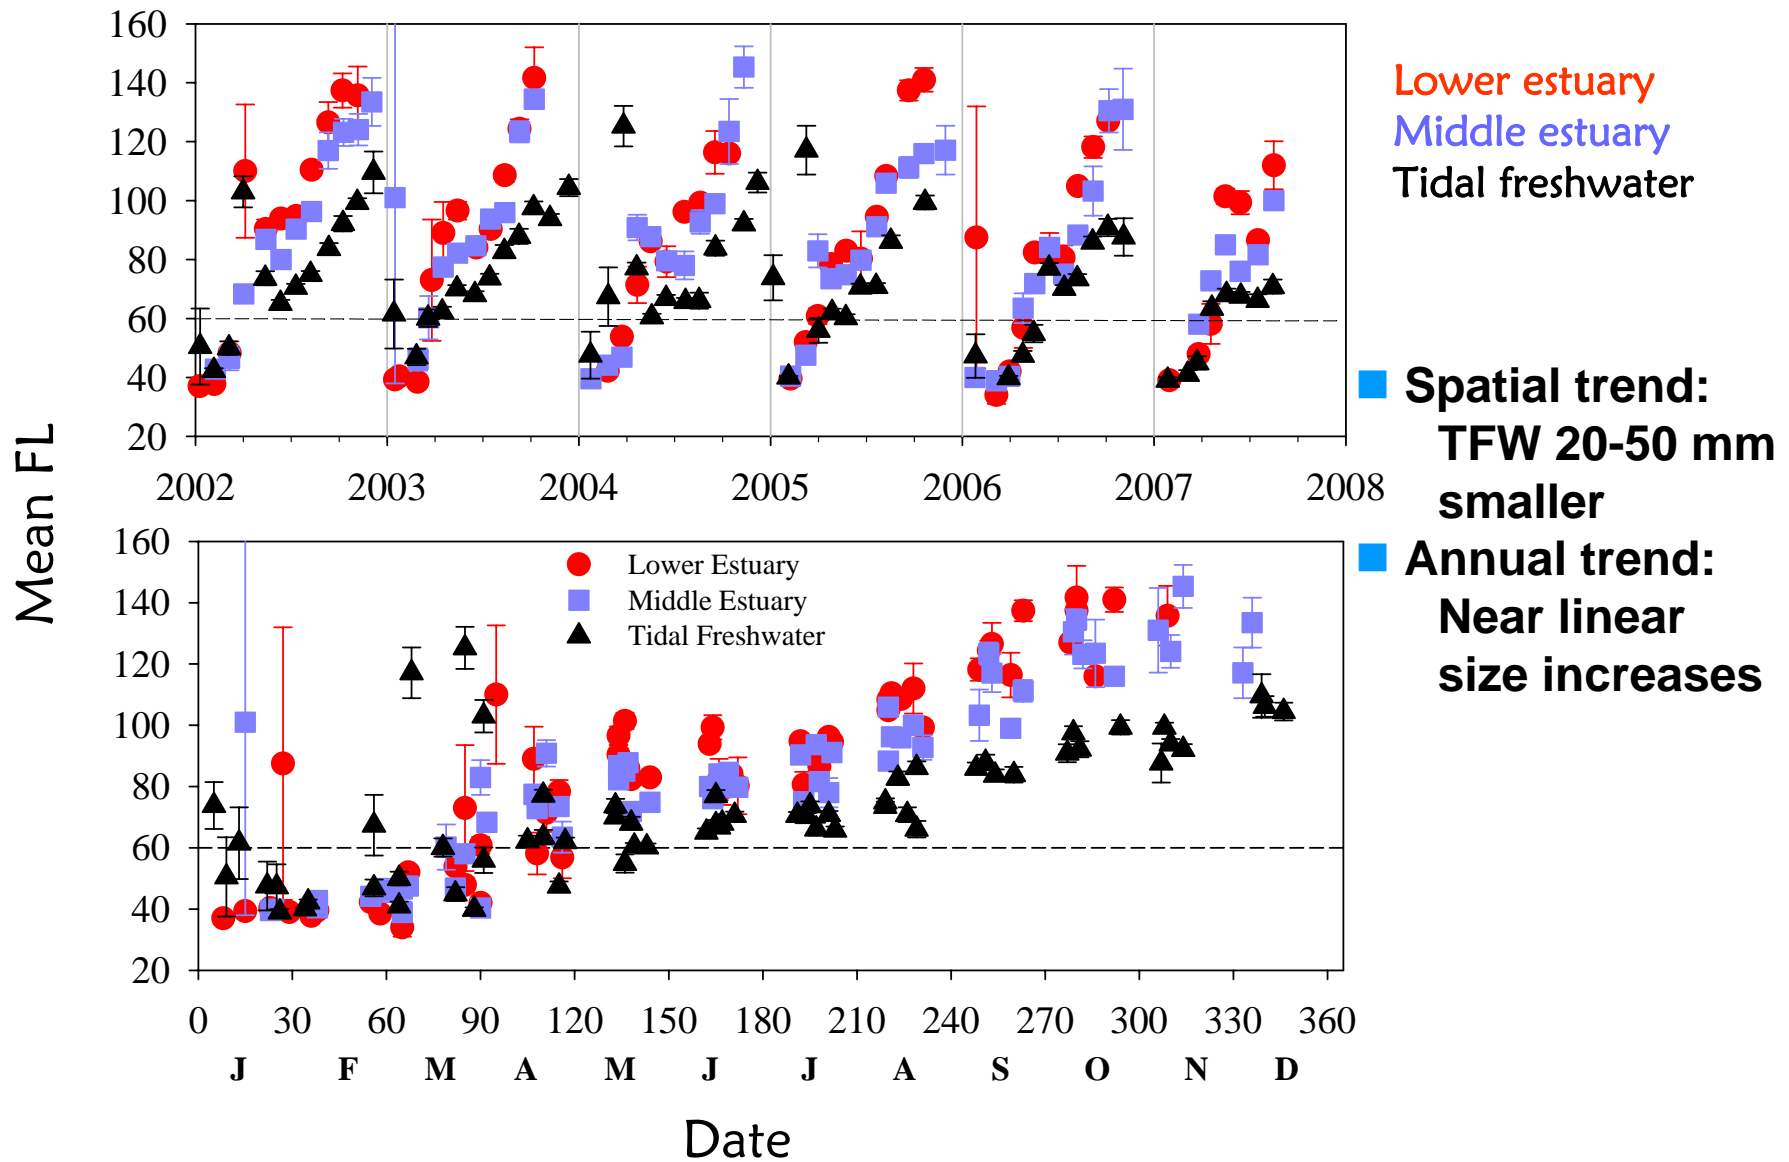

Chum abundance and size at beach seine sites in 2002-2007

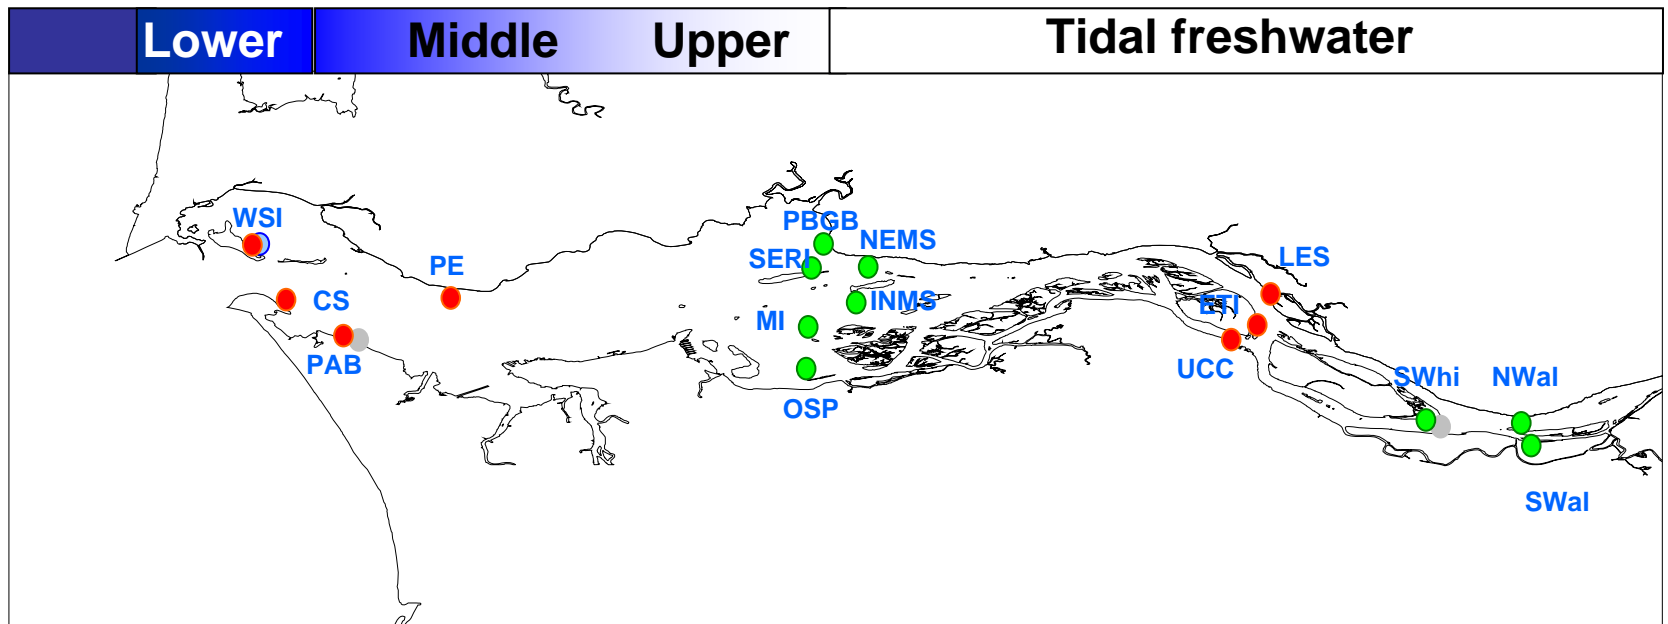

Chinook abundance and size at beach seine sites in 2002-2007

Chinook mean sizes 2002-2007

Chinook percent fry

Mean monthly percent

Lower estuary

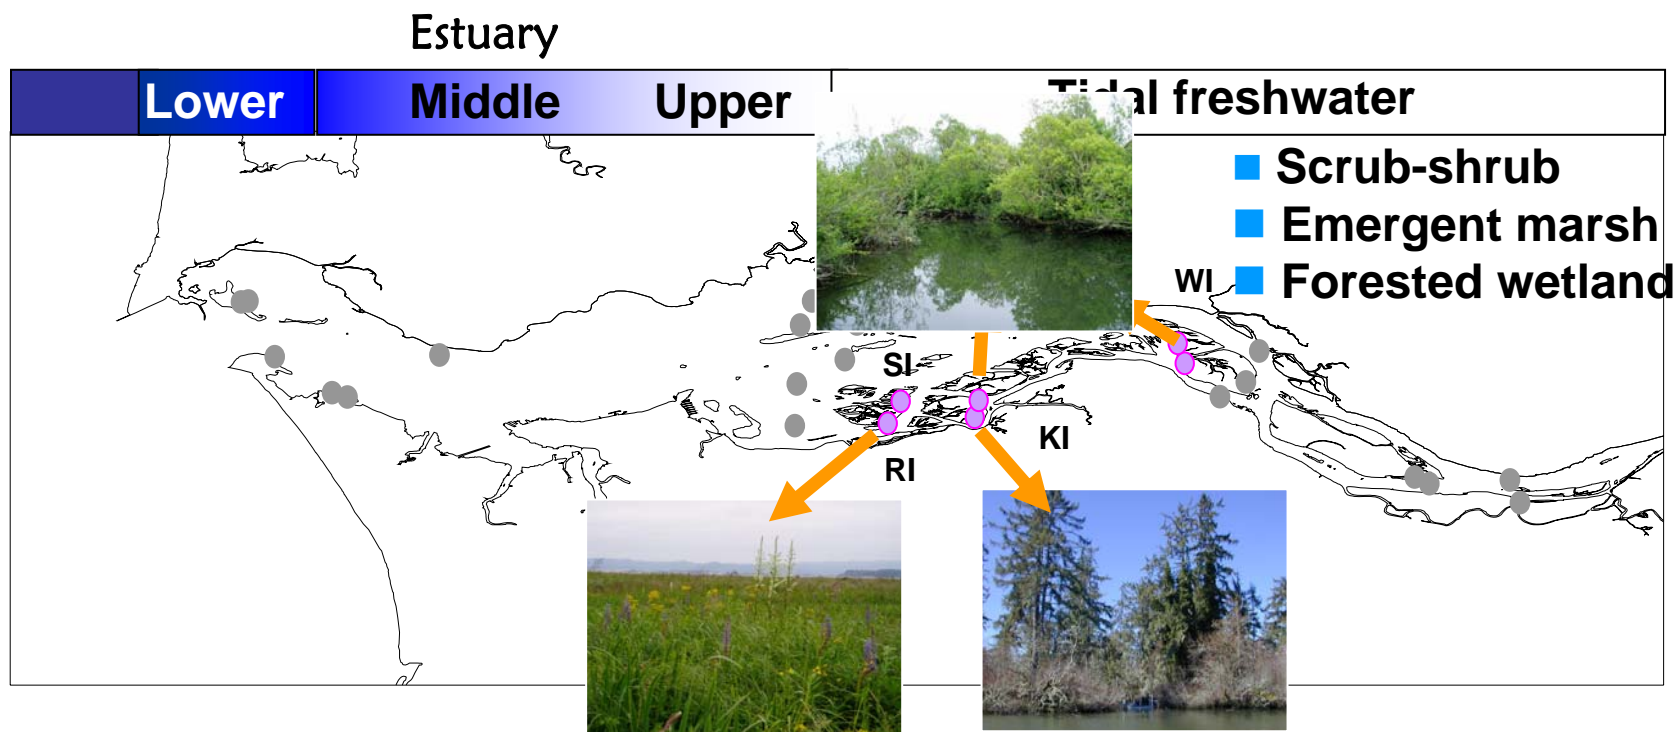

Middle estuary

Tidal Freshwater

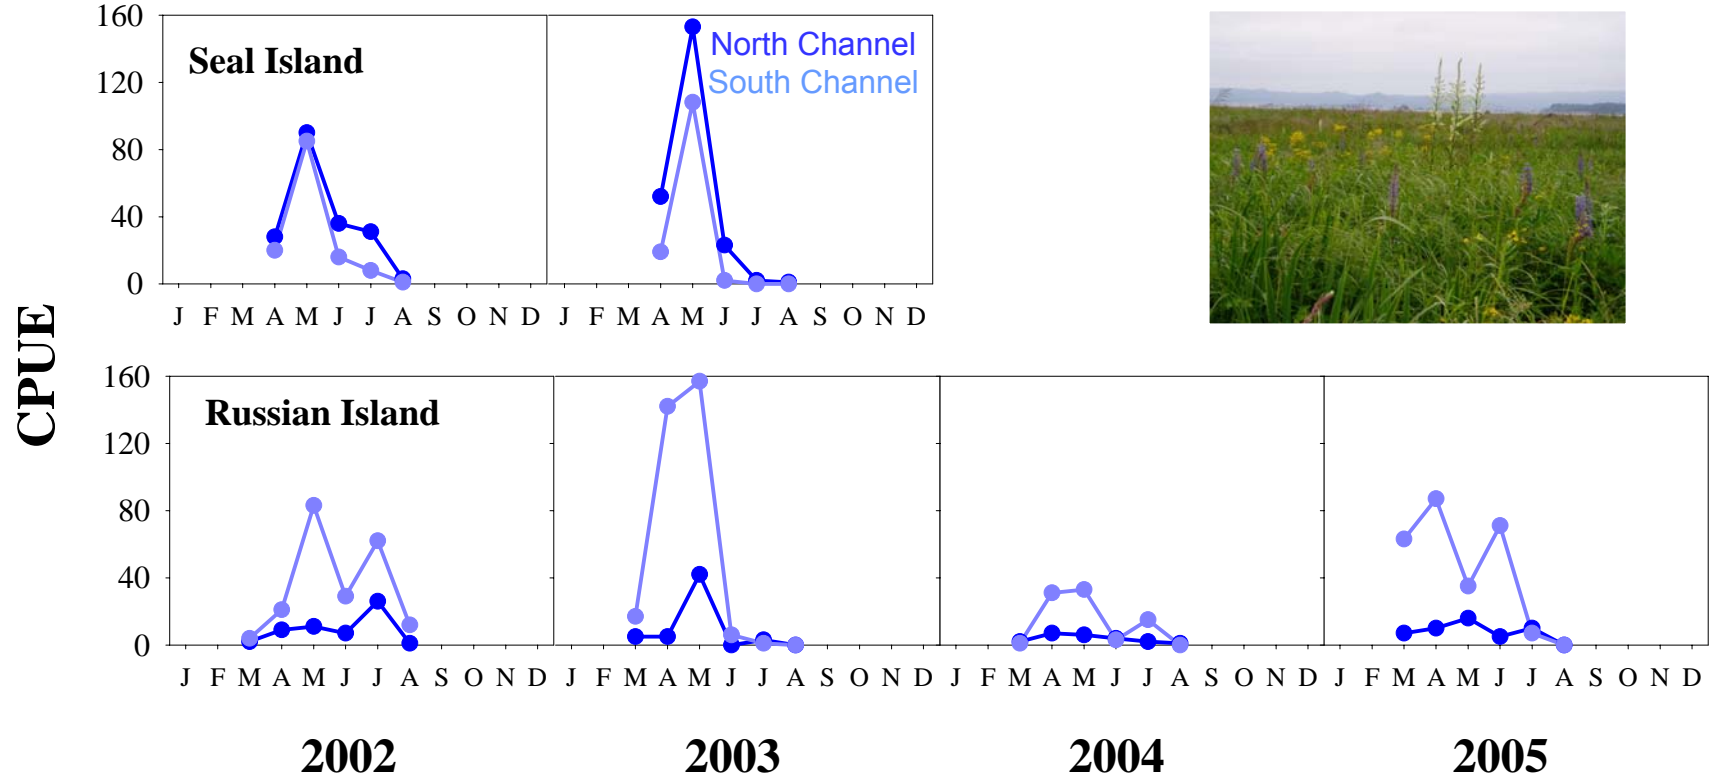

Month

Studies – Spatial and temporal scales

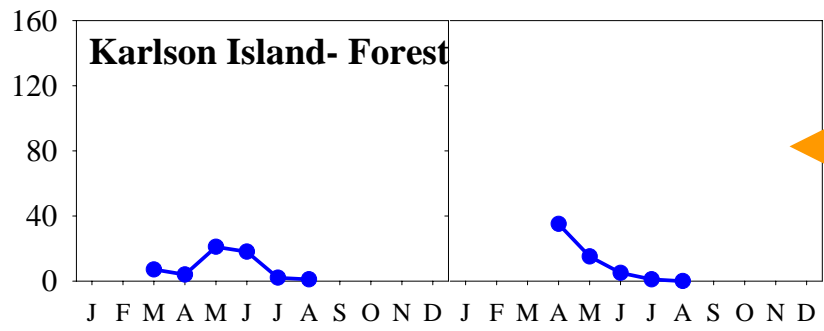

1. Purse seine vrs beach seine
2. Tidal freshwater Sandy River delta
3. Landscape-scale time series monitoring
4. Synoptic spatial-scale “snapshot”
5. **Wetland habitat use**

Emergent marsh sites

- **Spatial trend: Similar patterns between Islands**
- **Annual trend: Peaks in Apr-May, Absent Jul-Aug**

Trap net: Forested and Shrub sites

■ Spatial trend: Similar between sites
■ Annual trend: Peaks in Apr-May, Absent Jul-Aug

■ North Channel
■ South Channel

Size frequency by Habitat type

Observations

Emergent

Shrub

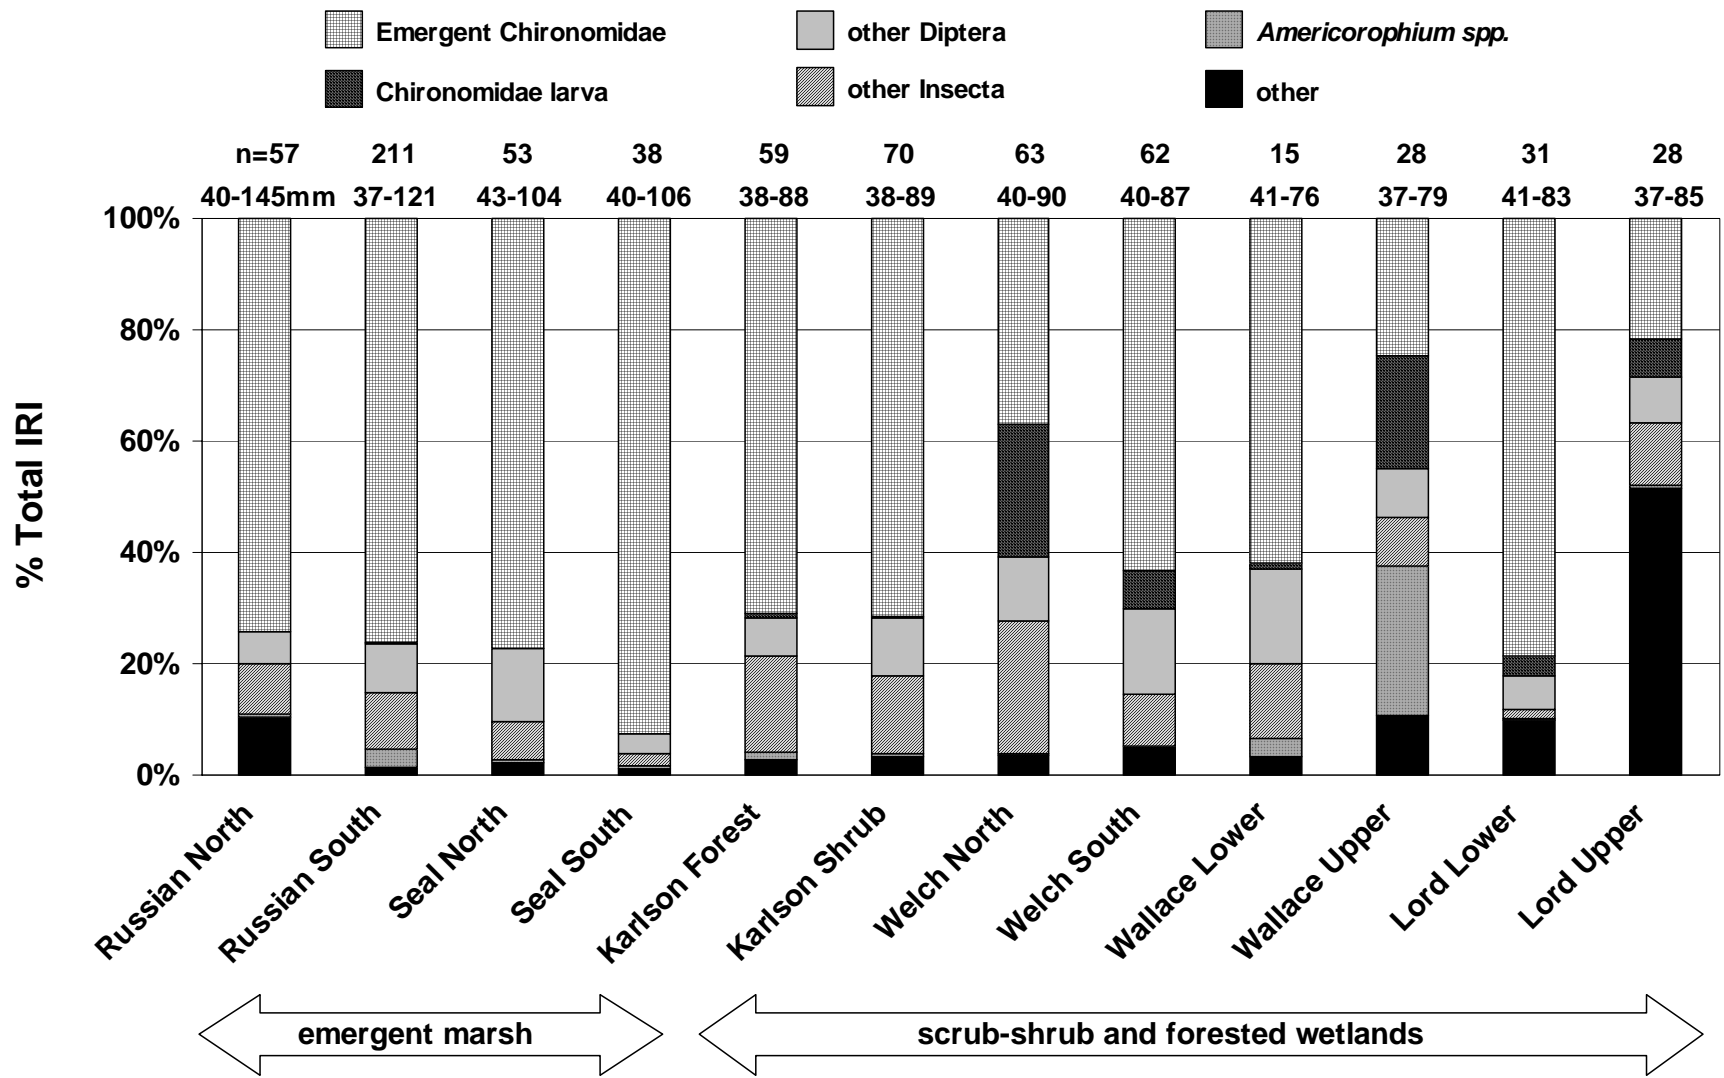

Forest

■ Fry < 60 mm dominate catch except in emergent marsh.
■ Fish present longer in emergent marsh.

Fork length

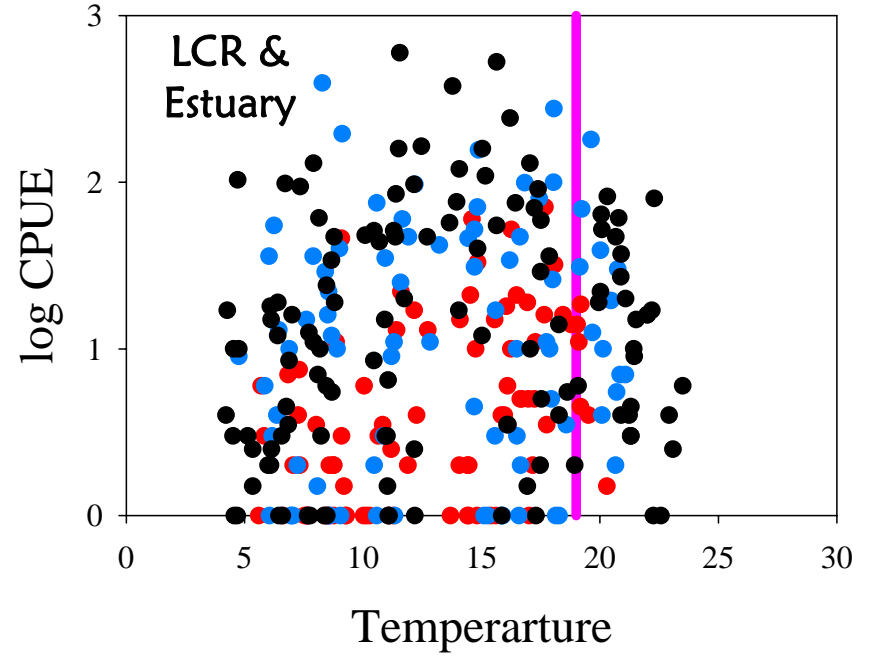

Chinook diet from wetland habitats

Chinook diet from beach seine sites

Chinook abundance and temperature

■ Stressed?

? Hatchery or Wild

9710 total Chinook examined

AD. Clip	Pelvic Clip	CWT	AD + CWT	PIT	Total	% Total	Mean FL	SD
222	48	19	78	2	369	3.8	125.3	42.5

1. Salmon are abundant in shallow water habitats at all spatial and temporal scales investigated. **Restoration will benefit migrants (and the rest of the ecosystem!).**
2. Chum are fry migrants that leave by May; subyearling Chinook have year-round presence. **Chum lacking spawning habitat; Chinook lacking rearing habitat.**
3. Chinook exhibit spatial trends in abundance and size over the estuarine gradient:
 - larger fish in marine influenced zones
 - higher CPUE in tidal freshwater zones**Identify and enhance juvenile rearing in estuarine transition zone.**
4. Chinook CPUE in main stem and wetland sites declines markedly >August, but abundance can be high at temperatures > 20°C. **Stressed?**
6. Salmon fry were commonly found as late as August at most shallow water habitats. **Origin?**
7. Very few fish were marked, and so origin is uncertain (presume most are hatchery). **Tag all hatchery fish! PIT tag all possible!**
